2026 POST 5 DAY 2 STATEMENT

Thank you for responding to our call for help. Last night on midnight we sent a foreman and 2 pumpers into the 3 South Tailgate Section to pump water that had accumulated on the section to get the shaft ready for ventilation purposes. Surface crews have prepped the surface and the intake shaft is open and ready for use. The surface crew will remain out at the intake shaft site if you need their assistance.

During the shift the foreman had called out and stated that they had been battling high methane concentrations throughout the shift and have been unsuccessful at pumping water due to that issue. The foreman stated that they had gotten the pump and necessary cables and lines to the site but have not yet hooked anything up. He stated that the power cable and discharge line from the borehole are there and ready to be hooked up. It was shortly after this call that we experienced a high spike in the fan chart and all communication in the mine was lost. We have since gotten all crews and personnel out of the mine with the exception of the foreman and 2 pumpers on the 3 South Tailgate Section. We sent our mine rescue teams in and were able to get within 5 blocks of the face but had to retreat due to a pack malfunction. A fresh air-base was setup at this location.

The mine is ventilated by an exhaust fan that is on the surface. The fan is currently running and must remain on to ventilate the rest of the mine. We do not want the fan shut off, stalled or reversed for any reason. In the section air normally intakes up the #1 entry and returns out the #3 entry. Floor elevation is common throughout the section.

All state and federal agencies are on site and back up teams are ready and on standby. Please find our missing miners.

2026 POST 5 DAY 2 INSTRUCTIONS

Account for all missing miners and bring survivors to the Fresh Air Base.

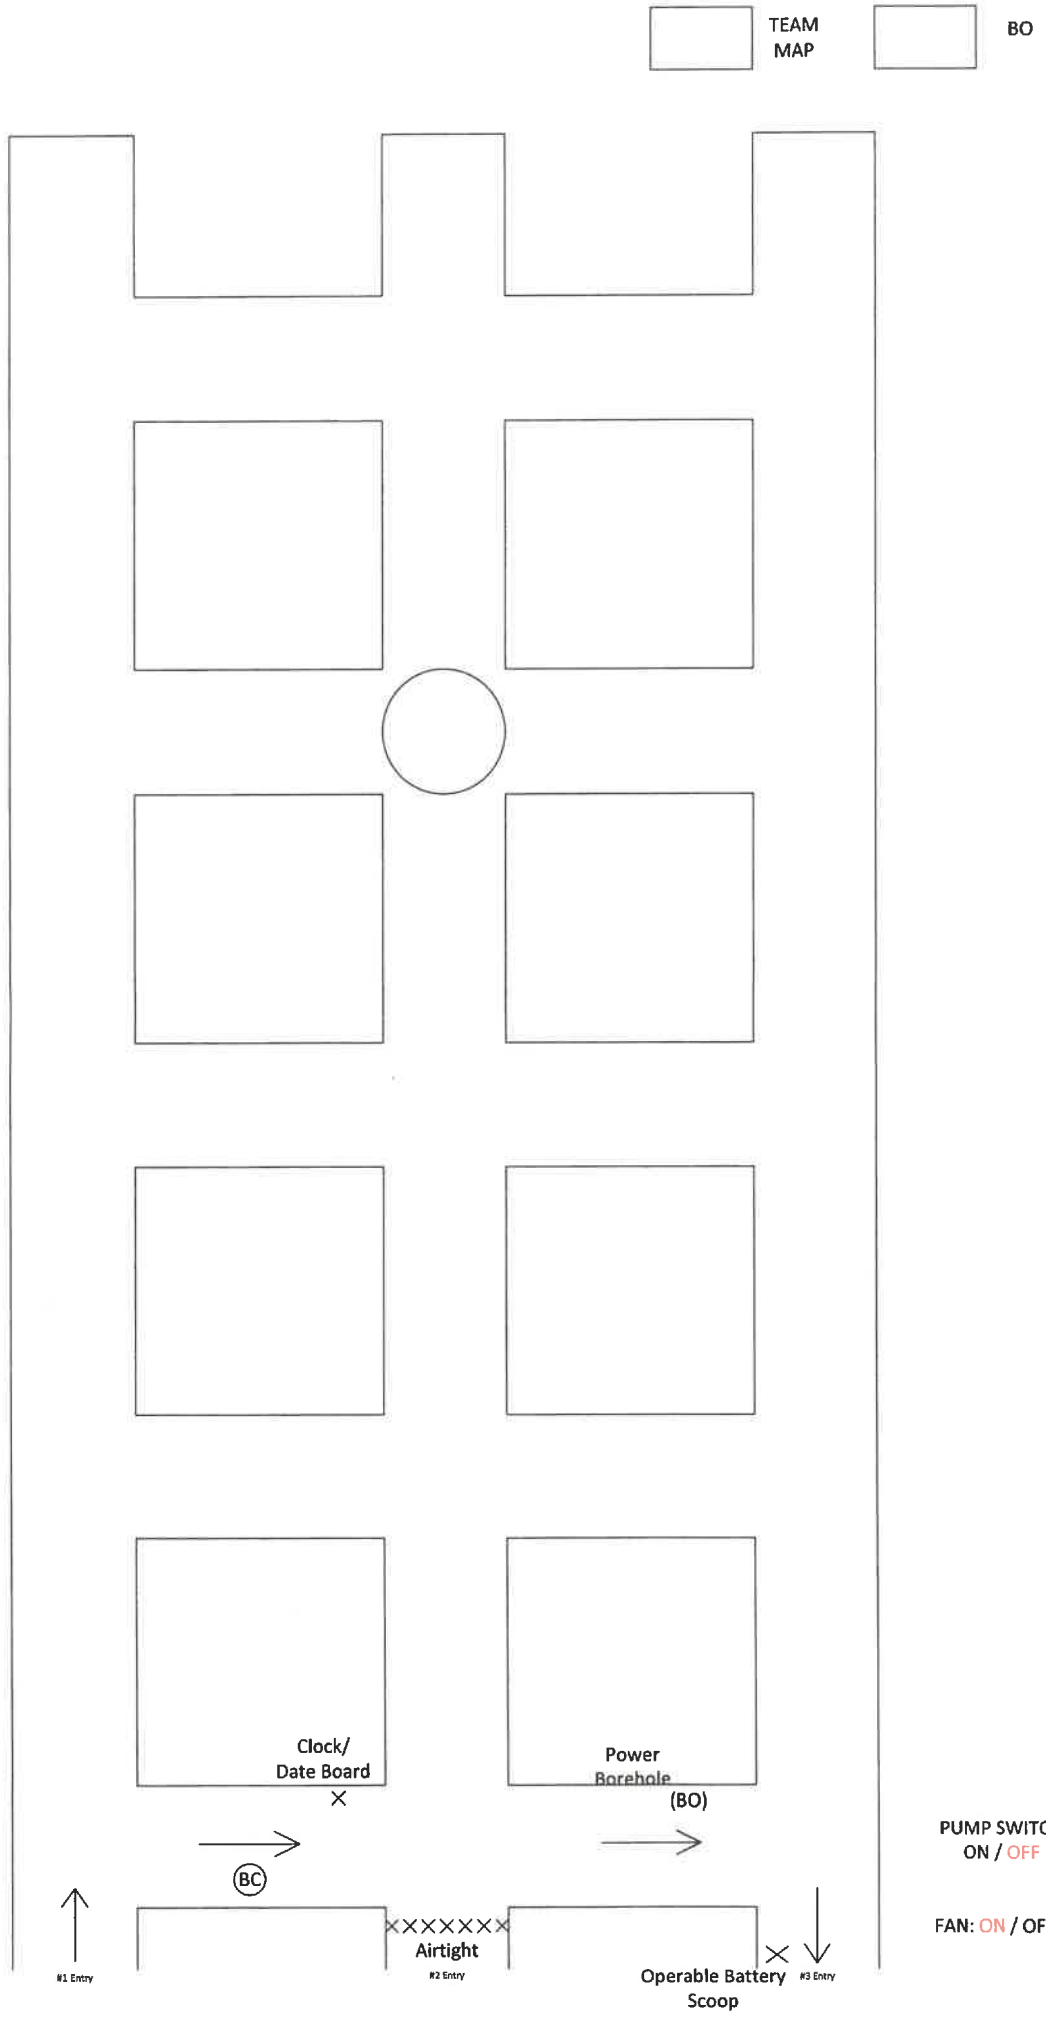

Explore all areas of the mine if safe to do so

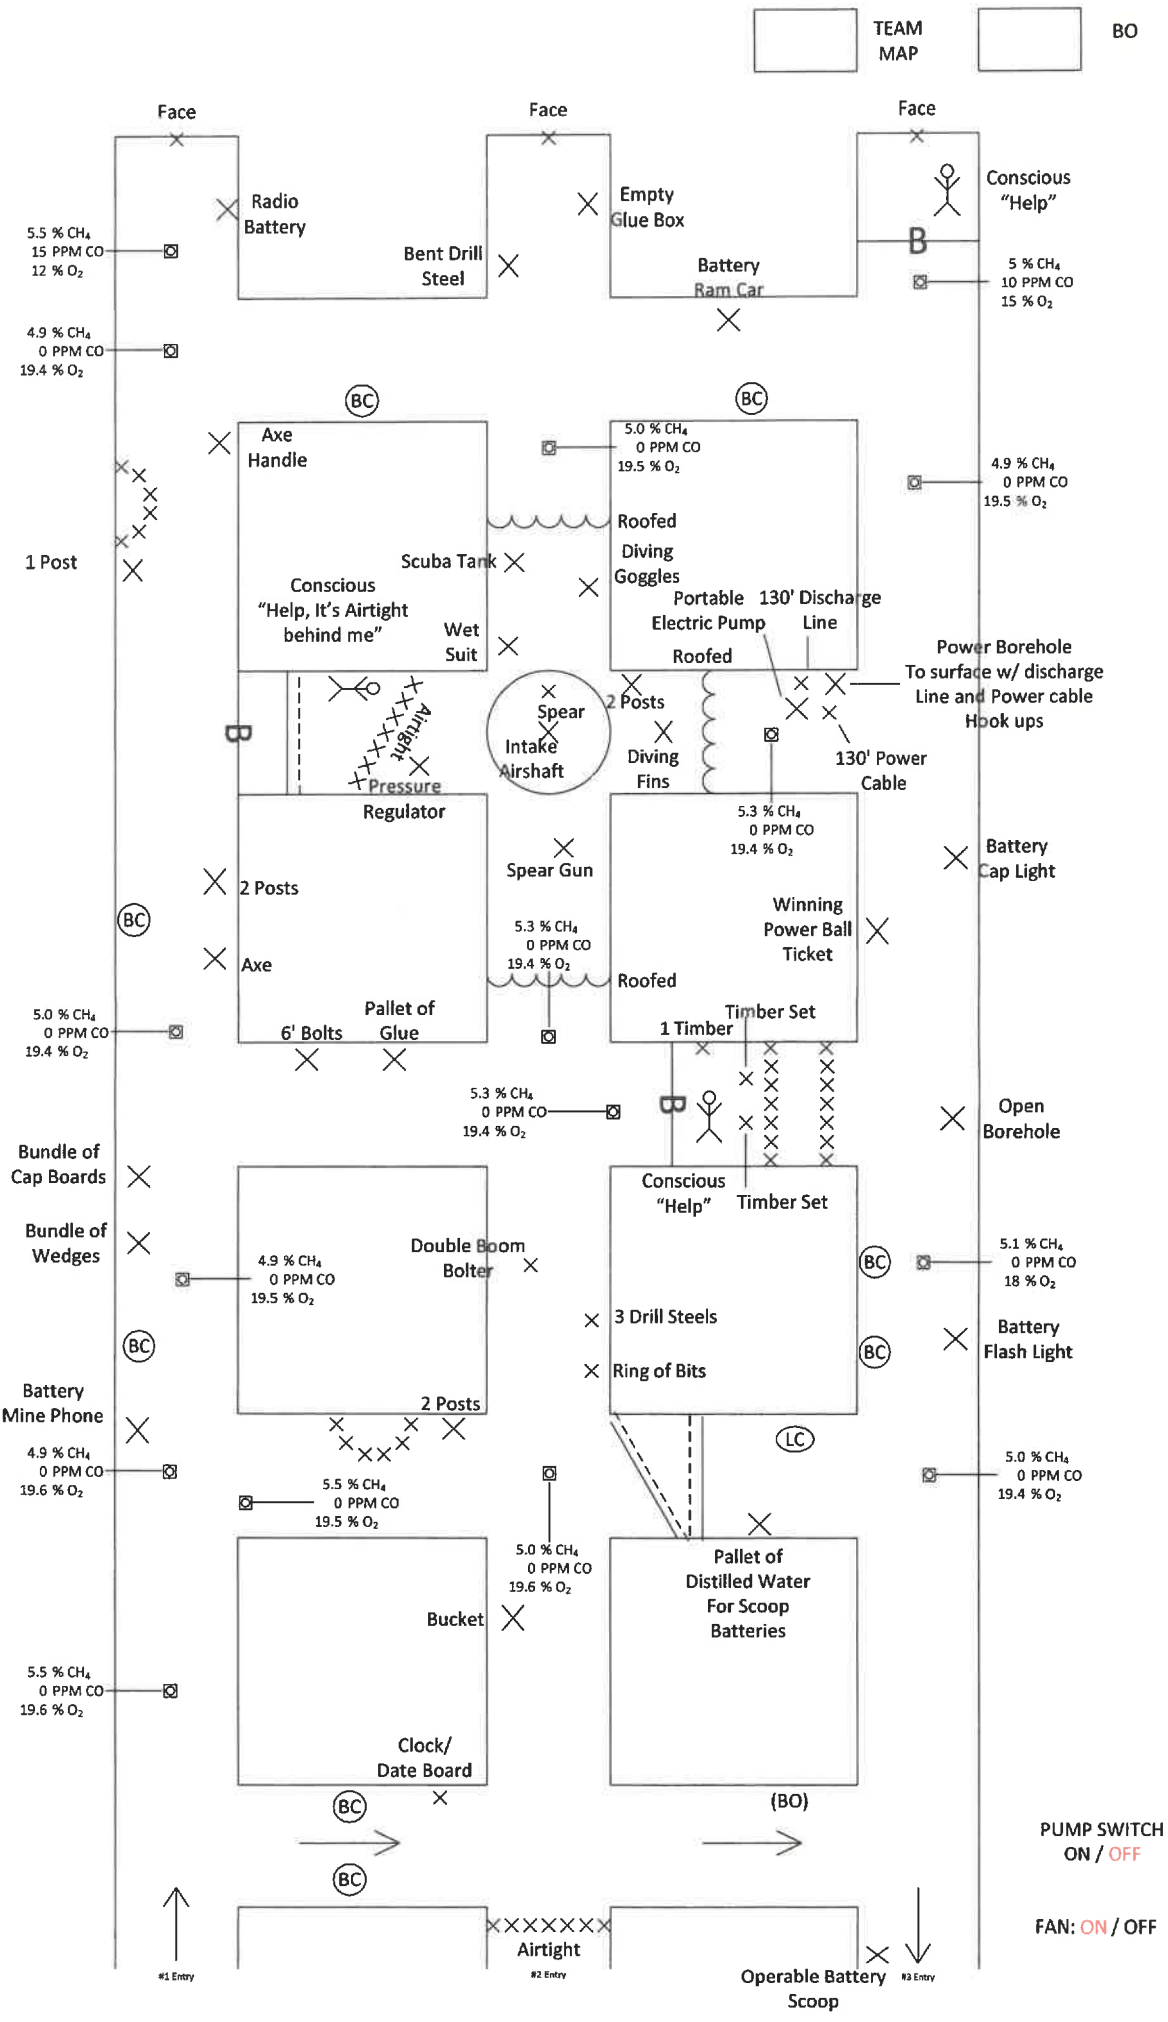

The exhaust fan cannot be stopped, stalled, or reversed

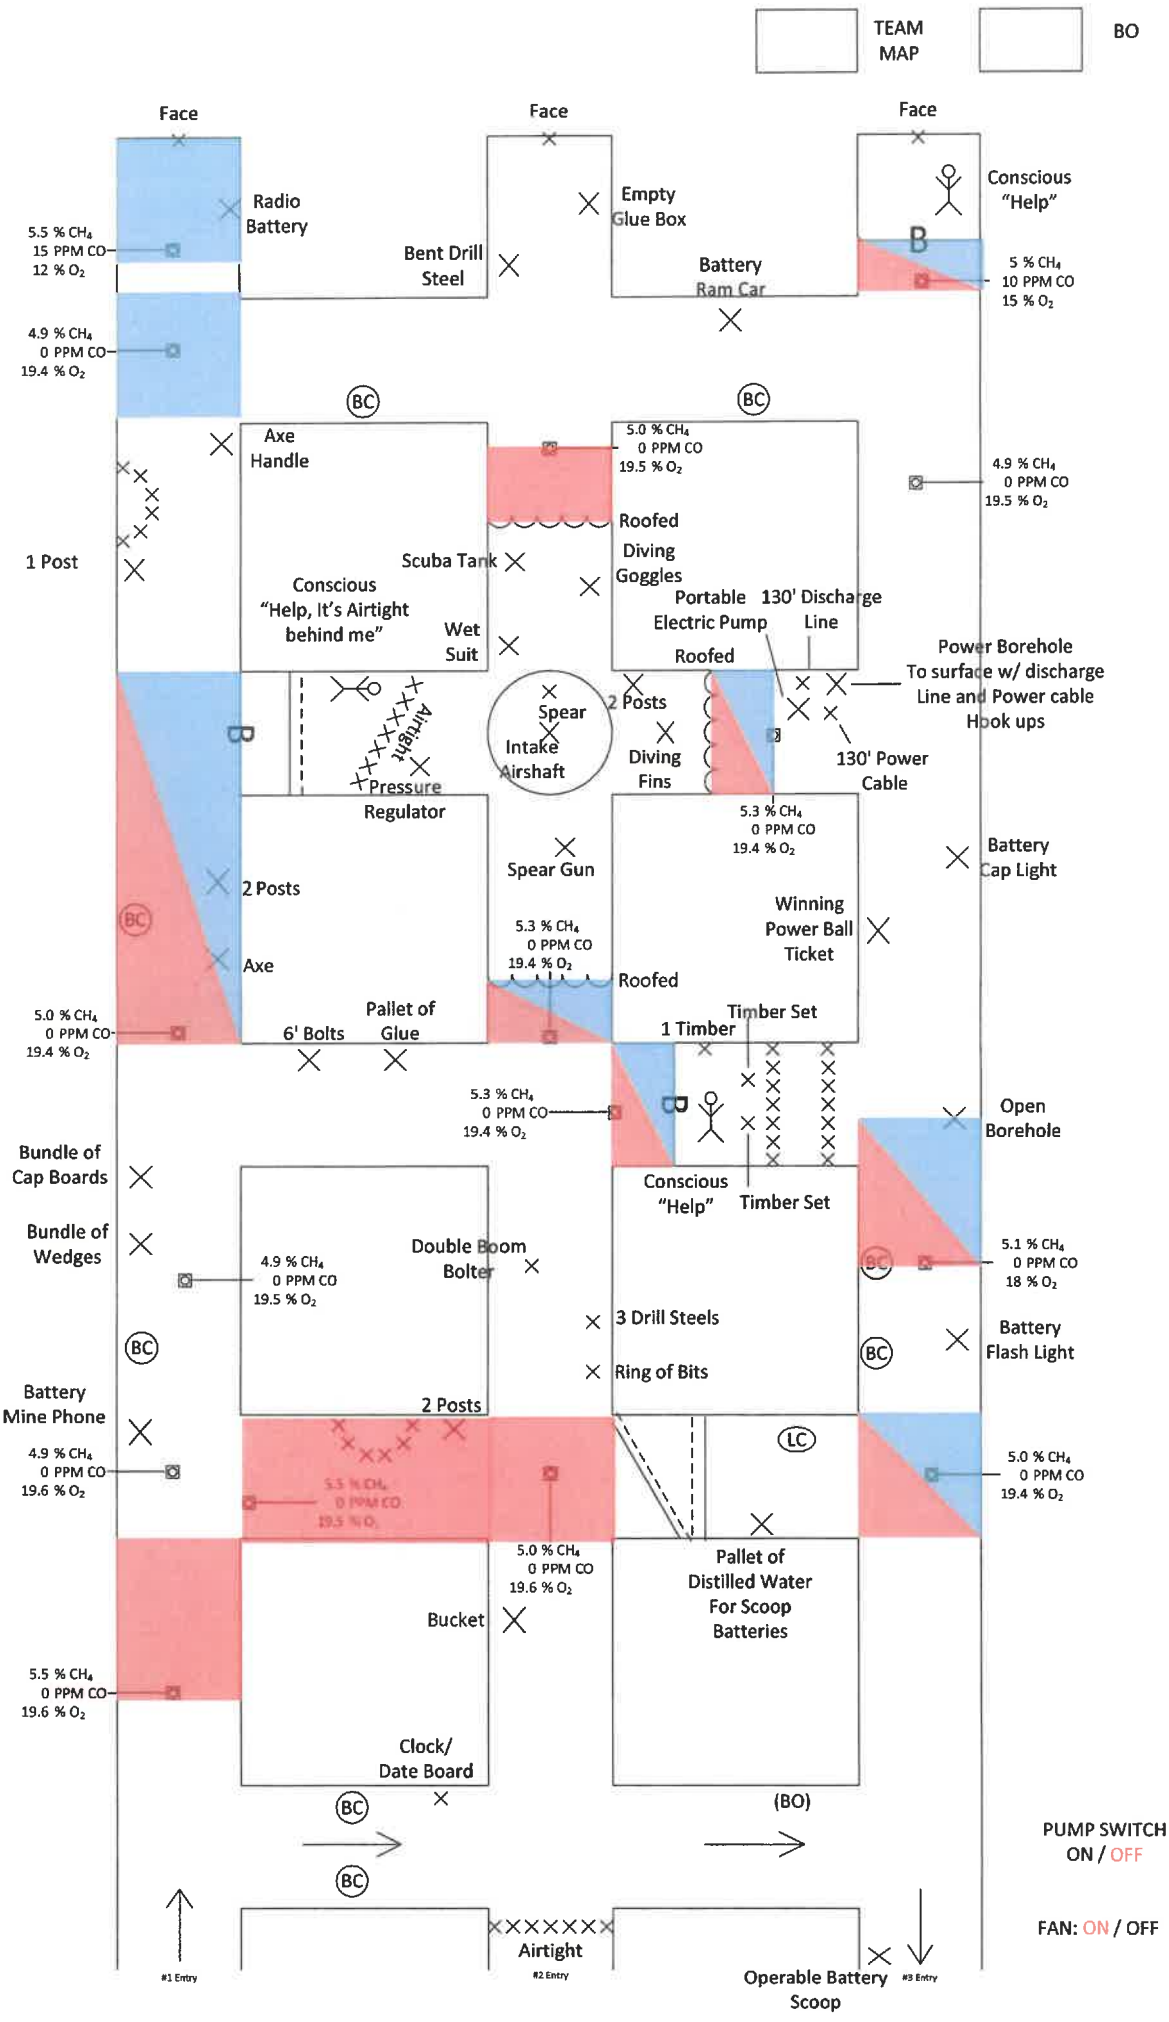

Pump power can be given with permission from the superintendent. The Pump Switch is located on the surface at the Intake Airshaft located on the section. The surface crew will control the switch for you at your request.

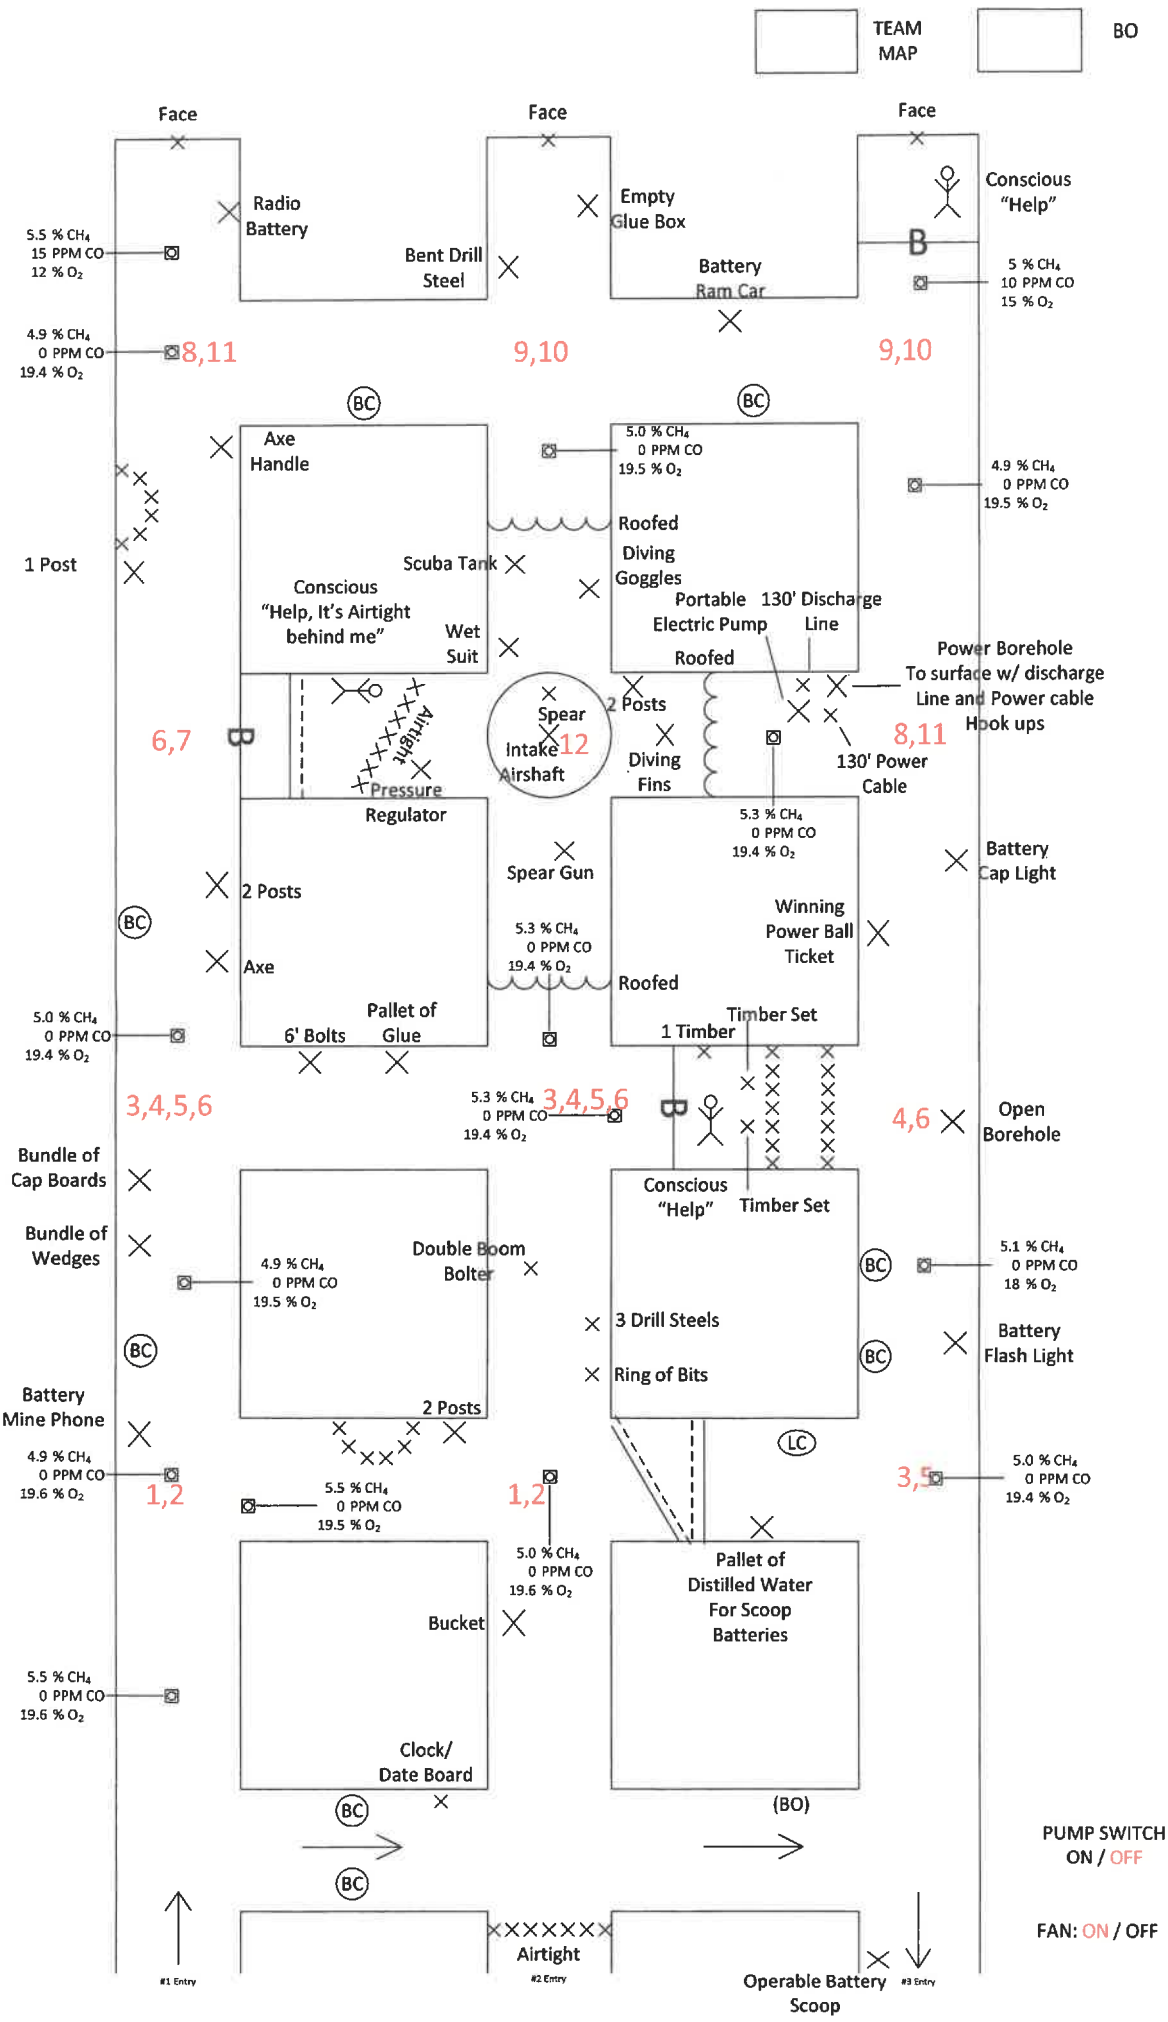

There is a 75 Minute time limit

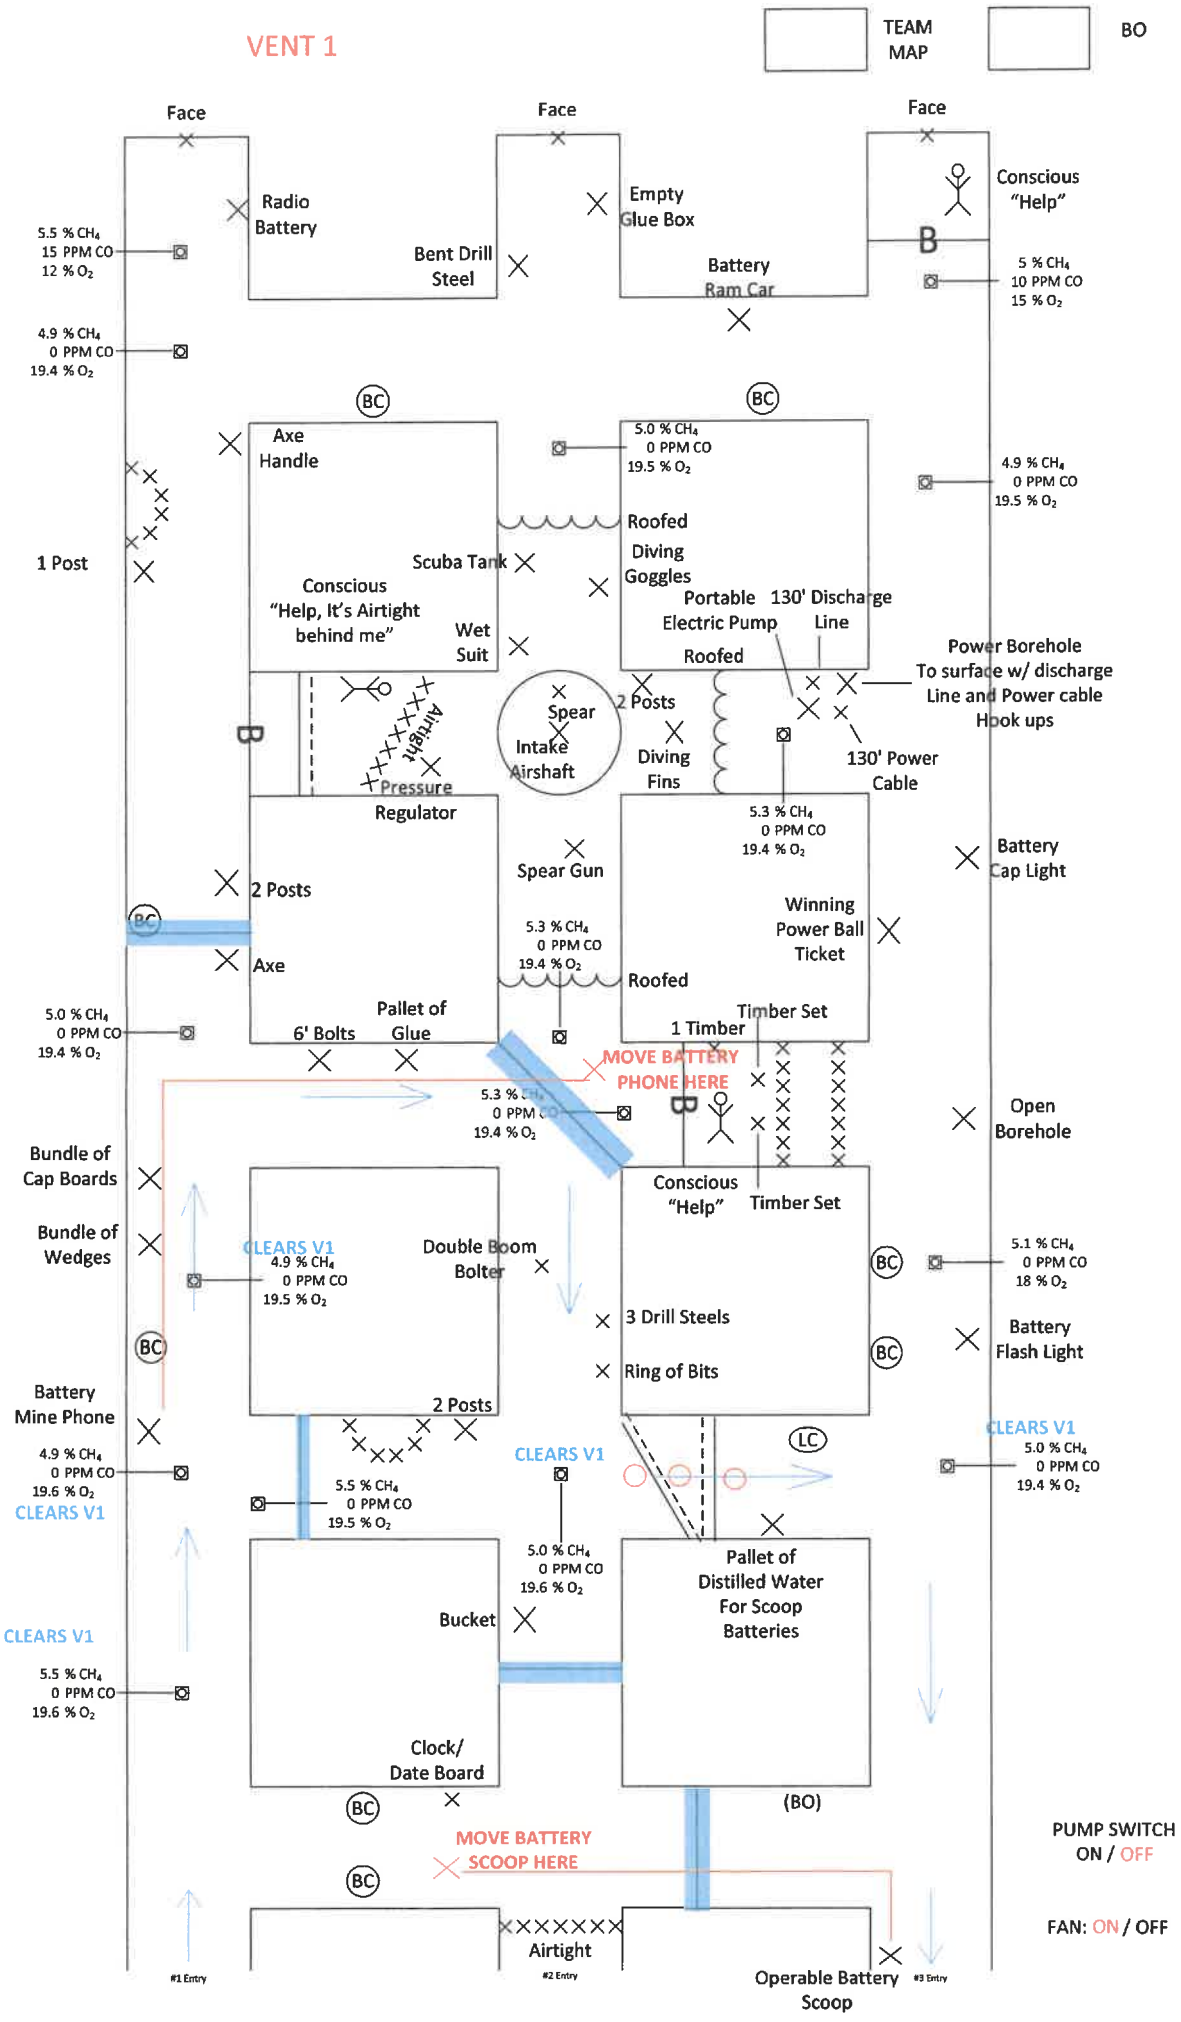

Good Luck!!
